

Strategic Sourcing & Team Topologies

Rethinking interaction modes for procurement

Elizabeth Ayer

Enterprise Technology Leadership Summit

8/20/24

**The problem we're
solving today**

Problem statement

We need to work together in larger groups than 6-9 people.

Sometimes we need to use mechanisms other than hiring to bring people into those groups.

Both of these are challenging on their own; how do we do them both at the same time?

Two goals today

1. **Embed a more nuanced and flexible model of contracting**
2. **Show how flexible contracting models support modern approaches to org design**

Contracting may...

- Allow greater flexibility
- Shorten time to bring people in
- Reduce costs
- Give access to in-demand skills
- Improve focus in the core business

But also... contracting-related pain points

Decisions based on cost not value

Long timelines

Misalignment between product, IT and procurement

Specialist knowledge needed

Weak accountability

So many requirements, so few outcomes

Illegible processes

Repeat actions with bad outcomes

Too few options to promote equity

Apparently contradictory policies

Insufficient capacity to manage

(etc)

Contracting often magnifies organizational weaknesses

**Today we'll focus on contracting and
organizational structure.**

Observations from 18F

The procurement history of 18F

When 18F started, contracts tended to be **too small** or **too big**.

California junks \$179 million Medicaid IT modernization project with Xerox

New Hampshire's Medicaid Billing Computer System Still Having Glitches

The system has cost more than \$117 million since the first contract was approved in 2005 for about \$60 million, with the most recent amendment adding \$6.8 million to the price tag.

Audit: Xerox's Montana Medicaid project could be 6 years late

Maryland fires firm upgrading Medicaid technology, may seek money back

N.J. ends \$118M contract designed to ease enrollment in Medicaid and other welfare programs

R.I. Gov. Raimondo wants payment-for-performance contract with computer contractor

Field Guide

Only 13% of large government IT projects succeed*

Implementing custom software projects can be extraordinarily costly and risky in a government setting. Waterfall software development remains standard at all levels of government. Outdated budgeting and oversight processes have been designed around these very waterfall processes. Moving toward a user-centered, agile approach to this work will save millions of dollars in spending on bad software.

Observations over 10 years

#1 The one-team case is very rare in government.

#3 Small change gets squeezed out over time.

=> Any contracting in service of major change must support flexible, multi-team organization.

Strategic Sourcing

Transactional services contracting

Attributes: Structured, explicit

Good for: Well-understood problems, defense against bad actors

Key phrase: “Never leave money on the table.”

Example: Data entry, travel services

“Power is a trap”

-Oliver Williamson

Outsourcing: Transaction cost economics and supply chain management

Relational services contracting

Attributes: Goal-oriented, builds mutual value

Good for: Early-stage problems, medium-trust situations

Key phrase: “*Always* leave money on the table.”

Example: Launching a new product, app modernization

See [Outsourcing: Transaction cost economics and supply chain management](#) by Oliver Williamson, 2008

Reading Team Topologies diagrams

Value is pulled by consumer

How do you get to a value-oriented structure?

In the absence of contracting, orgs *evolve* boundaries that allow decoupling.

Periods of collaboration to figure things out, move towards XaaS relationships for sustainable flow.

How do you get to value-oriented structures with contractor teams?

Answer: give yourself a good contracting foundation & evolve towards boundaries that allow decoupling.

Micro-example: “Discover to establish”

**Agency A
contracted with
Vendor V**

**Deprioritized
month-to month**

**Both thought that
liaising with states
was a one-person
job – incorrect!**

**Split teams using
natural “fracture
plane” - ringfenced
effort worked**

Micro-example: “Discover to establish”

The contractual foundation allowed for changing team composition, structure, and reporting by mutual agreement. This was critical to meeting the organizational need!

In short

Prefer **relational contracting** and **collaboration interactions** for less mature services/needs.

Work towards maturing them.

Summary

- **Single empowered Scrum team was the start**
- **Can use a range of contracting models from Strategic Sourcing**
 - **Relational often fits the software case better**
- **Expect more change in the less mature components and teams**
- **Org design needs change, but a contract setup can prematurely freeze structure**
- **Aim to mature boundaries as understanding increases**

Abstract

This article examines outsourcing from the transaction cost economics (TCE) perspective. The transaction is made the basic unit of analysis and the procurement decision, as between make and buy, is made (principally) with reference to a transaction cost economizing purpose. As sketched herein, the ease of contracting varies with the attributes of the transaction, with special emphasis on whether preserving continuity between a particular buyer–seller pair is the source of added value. The basic regularity is this: as bilateral dependency builds up, the efficient governance of contractual relations progressively moves from simple market exchange to hybrid contracting (with credibility supports) to hierarchy. This last corresponds to the “make” decision, which, as
